Operations Dashboard User Interface and Regulatory Override Guide

The KNPC Market Intelligence portal provides immediate, high-density visibility into global crude oil streams and regional downstream product proxies. This manual outlines the portal access guidelines, component layouts, and administrative manual override execution flows.

1. PORTAL GATE ACCESS CONTROL

When you launch the hosted Streamlit application link, you will encounter a secure access verification gateway challenge interface. Input the following structural credentials to authorize the dashboard layout:

- * Authorized Username: admin
- * Authorized Password: admin

If credentials fail to match standard registry properties, the security container terminates the execution pipeline and outputs an 'Invalid Credentials' flag to prevent unauthorized data telemetry mapping.

2. CENTRAL DASHBOARD INTERFACE BLUEPRINT LAYOUT

Once logged in, the workspace loads a single-page responsive grid split across five data blocks:

1. Petroleum Crude Oil Global Benchmarks: A card panel tracking real-time trading indexes for Brent, WTI, Oman, and Kuwait Export Crude (KEC). Displays latest values, net changes, percentage variances, and extraction origins.
2. Singapore / Regional Refined Product Price Proxies: Downstream product assessment grids tracking liquid proxy benchmarks (Naphtha, Gasoil 10ppm, Jet Kerosene, Fuel Oil 180/380 CST, Gasoline 92/95, LPG) when direct price feeds are hidden behind corporate paywalls.
3. Historical Volatility Trends: Interactive line charts visualization charts showing custom lookback curves based on the lookup window set inside your configuration parameters.
4. Intelligence Feed Wire: Real-time parsing ticker capturing global energy stream headlines crawled directly from public media oil networks.
5. Operational Field Corrections Ledger: A secure workspace grid form allowing users to directly run override commands.

3. ADMINISTRATIVE CONTROL MANAGEMENT TOOLS

Expanding the control sidebar utility parameters menu allows operators to run data synchronization overrides manually:

- Force Live Pipeline Loop: Commands background scrapers to fetch raw data rows from web endpoints immediately, bypassing standard execution schedules.
- Re-compile Excel Sheets: Instructs the engine to query historical tables and rebuild master

spreadsheets, updating all data tabs.

- **Download Daily Excel Report:** Downloads the compiled OpenPyXL spreadsheet matrix file directly to the local workstation.

4. FIELD CORRECTIONS LEDGER WORKFLOW (HANDLING MISSING FEEDS)

When an upstream data site undergoes layout changes or fails to publish on time, the system writes a default NULL value labeled with a red warning badge 'Source system didn't publish'. To resolve this without editing database tables manually, use the on-screen ledger form:

Step A: Scroll down to the 'Operational Field Corrections Ledger' input panel.

Step B: Select the target product (e.g., Naphtha) and the date from the drop-down selectors.

Step C: Type the fallback validated numerical value inside the 'Manual Price Override' input box.

Step D: Click 'Submit Operational Adjustment'.

The web interface will execute an 'INSERT OR REPLACE' command, immediately rebuilding the moving charts and clearing the warning badge across the production sheets.
